### Importance of selecting an investment policy

Since each provident fund member is unique and expectations for financial returns and acceptable risk levels are different, a member should be able to select investment policies that are most suitable, yet able to change them as necessary and as one ages in life. This will enable the member's savings in the provident fund to grow sufficiently to meet financial needs upon retirement. For example, a provident fund member who is young with a provident fund that has a longer period to invest, will be very resilient to price fluctuations the investments may have. Such member can choose investment policies that contain equities to generate prospects of long term returns higher than fixed income investments. On the other hand, a provident fund member nearing retirement do not have a comparably long period remaining to invest, hence principal protection is of primary importance. This member should instead choose policies centered on fixed income investments to mitigate the loss from price fluctuations and the risk of the provident fund balance being insufficient to support retirement.

2.

### Type of Member suitable for this Investment Policy

The policy invests in more than one master fund comprising fixed income funds, equity funds, alternative investment funds, and balanced funds, but the portion invested in equity funds will be capped at no more than 20% of the portfolio.

If the fund invests in foreign markets, the fund's policy may include the use of derivatives to hedge against foreign-exchange risks at the discretion of fund managers.

## Investment Objectives

To achieve an appropriate risk-adjusted return.

### This policy is suitable for

- Members who seek a financial return which is higher than general fixed income instruments.
- Members who want their PVD balance to grow and help provide financial support during retirement.
- Members who can accept the risk of investing in foreign equity securities and assets.

### This policy is not suitable for

- Members who require stable financial returns and full principal protection.
- Members who expect high financial returns.

## Fund performance

\* Note that past performance does not guarantee future performance \*

Note : Return is on a per annum basis (annualized).

Performance benchmark used to compare the fund managers' performance over the period measured consists of:

- 1.) Government Bond Index, 1-3 years (51%) and
- 2.) TBMA Short-term Government Bond Index (8.50%) and
- 3.) Corporate Zero Rate Return Index (BBB) 3-Year (8.50%) and
- 4.) 1-year Thai Baht Interest Rate Fix (THBFIX) plus average credit spread of A-rated 1-year instruments for period measured (17%) and
- 5.) SET50 Total Return Index (15%)

## 5.

### Investment risks

#### Warnings & Recommendation

- Although a flexible fund's return may fluctuate in the short term, or incur a loss, the return in the long term can outpace inflation.
- This policy is not restricted to set of regulations for requirement of investment particularly in instruments with low risk like mutual funds in money market. Therefore, the risk of this Fund is higher than the mutual fund in money market.

#### Explanation of Risk

- market risk

Market Risk means the risk that the values of securities which the Fund has invested may increase or decrease due to outside factors such as economic/ investment situations, political factors both internally and internationally which could be considered from the Standard Deviation (SD) of the Fund. If the Fund has a high SD, it is an indicator that the Fund has high a fluctuation from the changes in the prices of securities.

- exchange rate risk

Currency Risk is the possibility that changes in exchange rate will affect the value of investment units. For example, if a mutual fund invests in securities denominated in US Dollar during Thai Baht depreciation and the units are subsequently sold when Thai Baht appreciates, the mutual fund will receive lower return in Thai Baht. On the other hand, if the same fund invests in securities denominated in US Dollar during Thai Baht appreciation and the units are subsequently sold when Thai Baht depreciates, the mutual fund will receive higher return in Thai Baht. Therefore, currency hedging techniques as follows are key tools to manage such risk.

Hedging at discretion of the fund manager: Investors may be exposed to currency risk because it is the discretion of the fund manager whether to use a currency hedging technique.
