Importance of selecting an investment policy

Since each provident fund member is unique and expectations for financial returns and acceptable risk levels are different, a member should be able to select investment policies that are most suitable, yet able to change them as necessary and as one ages in life. This will enable the member's savings in the provident fund to grow sufficiently to meet financial needs upon retirement. For example, a provident fund member who is young with a provident fund that has a longer period to invest, will be very resilient to price fluctuations the investments may have. Such member can choose investment policies that contain equities to generate prospects of long term returns higher than fixed income investments. On the other hand, a provident fund member nearing retirement do not have a comparably long period remaining to invest, hence principal protection is of primary importance. This member should instead choose policies centered on fixed income investments to mitigate the loss from price fluctuations and the risk of the provident fund balance being insufficient to support retirement.

2.

Type of Member suitable for this Investment Policy

Summary of assets invested by this policy

The TMB US500 Equity Index Fund's policy is to invest in a foreign fund focusing on stocks which are the constituents of the S&P500 in an effort to replicate the performance of the S&P500 Index. The fund adopts a Passive Investment Strategy by holding units of the iShares Core S&P 500 ETF (master fund) averaging at least 80% of NAV during the financial year. This ETF is listed and traded on the New York Stock Exchange.

Investment Objectives

To achieve an investment return which is similar to the performance of the TMB US500 Equity Index Fund.

This policy is suitable for

- Members who can accept stock price fluctuations which may increase or decline lower than the original sum invested and result in a loss.
- Members seeking higher long term returns than general fixed income investments.
- Members who aim for their provident fund to appreciate sufficiently to support retirement.
- Members seeking to diversify investment risk by investing in foreign markets and can accept the risk of investing in foreign equity securities or assets.

This policy is not suitable for

- Members who require stable financial returns and full principal protection.
- Members who do not want to risk loss of principal due to investment in equities.

4.

Fund performance

* Note that past performance does not guarantee future performance *

Note : Return is on a per annum basis (annualized).

1. Performance benchmark used to compare the fund managers' performance over the period measured consists of the USD-denominated S&P500 Index Total Return Index adjusted into Thai Baht as of date of performance measurement.
2. Standard Deviation (S.D.) 16.90% p.a.

5.

Investment risks

Warnings & Recommendation

- The performance of a policy that invests in equities contains short-term fluctuations, or can even incur a loss. However, the return over the long term can outpace inflation.
- This policy investment is highly concentrated in USA and therefore investors should consider diversify the risks in their portfolio.

Explanation of Risk

- market risk

standard deviation : SD

Market Risk means the risk that the values of securities which the Fund has invested may increase or decrease due to outside factors such as economic/ investment situations, political factors both internally and internationally which could be considered from the Standard Deviation (SD) of the Fund. If the Fund has a high SD, it is an indicator that the Fund has high a fluctuation from the changes in the prices of securities.

High sector concentration risk

Remark : The concentration occurs among Information and Communication Technology

High country concentration risk

Remark : Remark : The concentration occurs among UNITED STATES

- exchange rate risk

Currency Risk is the possibility that changes in exchange rate will affect the value of investment units. For example, if a mutual fund invests in securities denominated in US Dollar during Thai Baht depreciation and the units are subsequently sold when Thai Baht appreciates, the mutual fund will receive lower return in Thai Baht. On the other hand, if the same fund invests in securities denominated in US Dollar during Thai Baht appreciation and the units are subsequently sold when Thai Baht depreciates, the mutual fund will receive higher return in Thai Baht. Therefore, currency hedging techniques as follows are key tools to manage such risk.

Hedging at discretion of the fund manager: Investors may be exposed to currency risk because it is the discretion of the fund manager whether to use a currency hedging technique.
